(RUSSIA to SPANISH by OTS 62-29230)

The effect of the change in the consistency of the stock entering the vat on the pressure of filtration and the physico-mechanical properties of the sheet being formed was examined at consistencies of 0.07, 0.10, 0.15, 0.20, 0.25, 0.30 and 0.40% and at degrees of beating of 20, 30, 45, 60 and 75° S.R., using bleached sulphite pulp mark "A". The results show that the pressure of filtration changes in linear relation to the quantity of liquid being filtered only at degrees of beating of the pulp of 20 and 30° S.R. At degrees of beating of 45° S.R. and higher the pressure of filtration

Discussions are presented on the effect of water hardness (total, and carbonate), of the cations and the anions of the salts giving rise to the hardness, and also of the cations Na^{+}, NH_4^{+}, Al^{+++} on the beating of cellulose and on the texture and the properties of paper. The dependence of the cellulose grinding process on the pH of the medium was also studied, since changes in the concentration of dissolved electrolytes induced changes in the hydrogen ion exponent. PROBLEMS CONCERNING THE DEFORMATION OF PULP FIBRES AND PULP BEATING. [1960] 5p.
11 refs.
Order from OTS or SLA $1.10 61-10680

Trans. of Bumazh[naya] Prom[yshlennost'] (USSR)
1959, v. 34, no. 12, p. 7-8.

DESCRIPTORS: *Wood pulp fibers, *Wood pulp, Mechanical properties, Processing.

Experiments showed that pulp undergoes the three kinds of deformations which occur in high molecular weight polymers: elastic, highly-elastic and plastic. This indicates that the deformation of pulp during beating has a relaxation character. Therefore the correct choice of the magnitude of the pressure and its frequency of application is very important. The speed and nature of beating depends largely on the ratio of the various kinds of deformation inherent to the fibre.
